

The Little Olive

STUDENT HANDOUT

Local development setup guide

This guide gets the backend API and the desktop app running on your own machine. It assumes **Windows** with **Docker Desktop** installed — that's the easiest path because Docker handles the database for you.

1 What you need installed first

Tool	Why
Docker Desktop	Runs the database and API server in containers, so you don't install Postgres by hand
Python 3.11	Runs the desktop app (Kivy) on your machine
Git	To clone the project

Open **Docker Desktop** once after installing it and make sure it says "Engine running" before continuing.

2 Get the code

Open PowerShell and run:

```
git clone <repository-url> TheLittleOlive
cd TheLittleOlive
```

3 Start the backend + database

Copy the example environment file, then let Docker build and start everything:

```
copy .env.example .env
docker compose up --build -d
```

First run takes a few minutes (downloading Postgres, building the API image). Check both containers are healthy:

```
docker compose ps
```

You should see `foodapp-postgres` and `foodapp-backend` both `Up`.

4 Seed the database

This creates an admin account, a test account, and some sample meals:

```
docker compose exec backend python init_db.py
```

Accounts created:

Admin → `admin@foodapp.com` / `AdminPass123!`

Test user → `user@example.com` / `UserPass123!`

5 Check the API is up

Open in your browser:

- `http://localhost:8000/health` — should return `{"status": "healthy"}`
- `http://localhost:8000/api/docs` — interactive API docs (Swagger UI)

6 Run the desktop app

The app is a Python/Kivy desktop client, run separately from the backend, in its own virtual environment:

```
python -m venv venv
venv\Scripts\activate
pip install -r requirements.txt
python kivy_app\main.py
```

A window titled "Food Ordering App" should open on the login screen. Log in with either account from Step 4.

7 Stopping / restarting

Stop everything:

Start again later:

```
docker compose down
```

```
docker compose up -d
```

Your data stays in a Docker volume between restarts — you only need to run `init_db.py` once.

8 Troubleshooting

"Login failed: 401 Client Error"

The email/password typed doesn't match a real account. Retype the credentials from Step 4 rather than trusting what's shown in the empty form fields — those are grey placeholder hints, not real text.

Port 8000 or 5432 already in use

Something else on your machine is using that port. Find and stop it, or change the host-side port mapping in `docker-compose.yml` (the number before the colon in `"8000:8000"`).

Kivy window doesn't open / import errors

Make sure the virtual environment is activated (`venv\Scripts\activate` — your prompt should show `(venv)`) before running `python kivy_app\main.py`.

Docker commands fail immediately

Docker Desktop isn't running. Open it from the Start menu and wait for it to finish starting up.

The Little Olive — local dev setup. Backend runs at `http://localhost:8000` ; the desktop app reads that address from the `FOODAPP_API_BASE_URL` environment variable if you ever need to point it elsewhere.
